

Conformational Motion And Disorder In Low And High Molecular Mass

Conformational Motion And Disorder In

Anupa Majumdar, Samrat Mukhopadhyay, in *Methods in Enzymology*, 2018. 3.1 Characterization of the Conformational Preference of IDPs: Collapsed or Extended. IDPs are known to adopt various conformations including a premolten globule, a structured molten globule, an extended random coil, and a transiently structured conformation (Dunker et al., 2001). In this section, we highlight the utility of ...

Molten Globule - an overview | ScienceDirect Topics

Diarthrodial joints exhibit complicated mechanics, characterized by high nominal contact pressures ~ 5 mPa (Hodge et al., 1986, Morrell et al., 2005), slow reciprocating speeds $\sim < 1$ mm/sec, and flattening of cartilage surface asperities under load. Cartilage compressibility and resultant extracellular fluid flows created by cartilage under pressure serve a major role in the ability of ...

In statistical mechanics, entropy is an extensive property of a thermodynamic system. It is closely related to the number Ω of microscopic configurations (known as microstates) that are consistent with the macroscopic quantities that characterize the system (such as its volume, pressure and temperature). Under the assumption that each microstate is equally probable, the entropy is the natural ...

Entropy - Wikipedia

The portion of a biological system's energy that can perform work when temperature and pressure are uniform throughout the system. (The change in free energy of a system is calculated by the equation $\Delta G = \Delta H - T\Delta S$, where H is enthalpy [in biological systems, equivalent to total energy], T is absolute temperature, and S is entropy.)

Biology chapter 8 Test Flashcards | Quizlet

Actin is a family of globular multi-functional proteins that form microfilaments. It is found in essentially all eukaryotic cells (the only known exception being nematode sperm), where it may be present at a concentration of over 100 μM ; its mass is roughly 42-kDa, with a diameter of 4 to 7 nm. An actin protein is the monomeric subunit of two types of filaments in cells: microfilaments, one ...

Protein structure determination. In terms of the accuracy of protein structure determinations, all of the bond lengths are invariant. Bond angles are also essentially invariant, except perhaps for , the backbone N-C alpha-C angle. The alpha-carbon is tetrahedral, which would give 110° , but there are indications from accurately refined protein structures (Deisenhofer and Steigemann, 1975 ...

MUSCLE. Motion, as a reaction of multicellular organisms to changes in the internal and external environment, is mediated by muscle cells. The basis for motion mediated by muscle cells is the conversion of chemical energy (ATP) into mechanical energy by the contractile apparatus of muscle cells. The proteins actin and myosin are part of the contractile apparatus.

Parkinson's disease (PD) is a common disorder of middle-aged and elderly people in which degeneration of the extrapyramidal motor system causes significant movement problems. In some patients, however, there are additional disturbances in sensory systems including loss of the sense of smell and auditory and/or visual problems. This paper is a general overview of the visual problems likely to ...
