of discrete-event simulation and provide practice in utilizing concepts found in the text. Answers provided here are selective, in that not every problem in every chapter is solved. Answers in some instances are suggestive rather than complete. These two caveats hold particularly in chapters where building of computer simulation models is required.

SOLUTION MANUAL OF DISCRETE EVENT SYSTEM SIMULATION BY JERRY BANKS, JOHN S. CARSON II, BARRY L. NELSON, DAVID M. NICOL. The fraction of trucks finding the crane busy upon arrival is $1 - P_0 = .997 = 99.7\%$ The long run proportion of time the crane is busy is $\rho = 1.0$ (c) With two cranes to unload trucks, $c = 2$.

Simulation is the imitation of the operation of a real-world process or system over time. Simulation involves the generation of an artificial history of the system, and the observation of that artificial history to draw inferences concerning the operating characteristics of the real system that is represented.

Discrete event simulation. Instead of being event-based, this is called an activity-based simulation; time is broken up into small time slices and the system state is updated according to the set of activities happening in the time slice. Because discrete-event simulations do not have to simulate every time slice,...
