### **Causes of Mutation and DNA Damage- Irradiation - Study.com**

DNA repair is a collection of processes by which a cell identifies and corrects damage to the DNA molecules that encode its genome. In human cells, both normal metabolic activities and environmental factors such as radiation can cause DNA damage, resulting in as many as 1 million individual molecular lesions per cell per day. Many of these lesions cause structural damage to the DNA molecule ...

The cell cycle, or cell-division cycle, is the series of events that take place in a cell leading to duplication of its DNA (DNA replication) and division of cytoplasm and organelles to produce two daughter cells. In bacteria, which lack a cell nucleus, the cell cycle is divided into the B, C, and D

periods. The B period extends from the end of cell division to the beginning of DNA replication.

You need to know the basic process of DNA replication and how it relates to the transmission and conservation of genetic information. You need to know that mutations in the DNA sequence may or may not result in phenotypic change and how mutations in gametes may result in phenotypic changes in offspring.

Return to top. Plasmid Elements. Plasmids used by scientists today come in many sizes and vary broadly in their functionality. In their simplest form, plasmids require a bacterial origin of replication (ORI), an antibiotic-resistance gene, and at least one unique restriction enzyme recognition site.
