Non-Mendelian inheritance patterns Complex and multifactorial inheritance. Some traits or characteristics display continuous variation, a range of phenotypes that cannot be easily divided into clear categories. In many of these cases, the final phenotype is the result of an interaction between genetic factors and environmental influences.

Human Genetics This section investigates how geneticists analyze genetic data from families to track the inheritance of human genes. It also explores the genetic and environmental factors that influence human genetic traits and disorders, and discusses how geneticists detect and treat human genetic disorders. +

INHERITANCE PATTERNS AND HUMAN GENETICS 235 CHROMOSOMES AND INHERITANCE Francis Collins and his lab group discovered the gene responsible for cystic fibrosis (CF). Cystic fibrosis often is a fatal genetic disorder. Thick, sticky mucus builds up and blocks ducts in the pancreas and intestines and causes difficulty in breathing.

Inheritance Patterns. It is important to understand the basic laws of inheritance to appreciate how conditions are passed on in a family. An accurate family health history is a valuable tool to illustrate how conditions are passed down through generations. A person has two copies of almost every gene, one copy from mom and one copy from dad.

Human genetics is the study of inheritance as it occurs in human beings. Human genetics encompasses a variety of overlapping fields including: classical genetics, cytogenetics, molecular genetics, biochemical genetics, genomics, population genetics, developmental genetics, clinical genetics, and genetic counseling. Genes can be the common factor of the qualities of most human-inherited traits.

Human matings, like those of experimental organisms, show inheritance patterns both of the type discovered by Mendel (autosomal inheritance) and of sex linkage. Because controlled experimental crosses cannot be made with humans, geneticists must resort to scrutinizing records in the hope that informative matings have been made by chance.

All inheritance patterns have been described and depend on the specific cause. However, the majority of cases are of complex inheritance, resulting from multiple genes and environmental factors. Recently, a gene for van der Woude syndrome (VWS), which includes lip pits and CL/P, was identified; the gene is the interferon regulatory factor 6 (IRF6).

"Patterns of Inheritance" - phenotypes (appearances) that occur in repeated, predictable patterns. See table 12-1 on pg. 228. Carrier - Has 1 copy of a recessive allele, but does not express it. They can, however, pass it on to their offspring. Genetic Disorders - diseases or debilitating conditions that have a genetic base.

Chapter 12 Inheritance Patterns and Human Genetics

Patterns of Inheritance The phenotype of an individual is determined by his or her genotype. The genotype is determined by alleles that are received from the individual's parents (one from Mom and one from Dad). These alleles control if a trait is "dominant" or "recessive". Additionally, the location of the alleles in the genome determine [...]

the class to begin to understand genetics, they will first study variation in human traits. Students will start learning about the study of heredity by surveying their own features. They will learn that they possess single gene traits with simple dominance inheritance patterns such as earlobe attachment, tongue rolling, and bent little finger.
