The origins of algebra can be traced to the ancient Babylonians, [page needed] who developed a positional number system that greatly aided them in solving their rhetorical algebraic equations. The Babylonians were not interested in exact solutions but approximations, and so they would commonly use linear interpolation to approximate intermediate values.

In linear algebra, an eigenvector or characteristic vector of a linear transformation is a non-zero vector that changes by only a scalar factor when that linear transformation is applied to it. More formally, if  $T$  is a linear transformation from a vector space  $V$  over a field  $F$  into itself and  $v$  is a vector in  $V$  that is not the zero vector, then  $v$  is an eigenvector of  $T$  if  $T(v)$  is a scalar ...

Systematic Program Design. A program interacts with people, dubbed users, and other programs, in which case we speak of server and client components. Hence any reasonably complete program consists of many building blocks: some deal with input, some create output, while some bridge the gap between those two.

Mathematics is one of the oldest disciplines of study. For all its antiquity, however, it is a modern,

rapidly growing field. Only 70 years ago, mathematics might have been said to consist of algebra, analysis, number theory and geometry.
